

Les Veilleurs — Frame of the lenticular screen

Consultation file v01 · September 2026 · stainless steel fabrication — request for constructive advice and quotation

1. What it is

A permanent artwork on the Belgian coast (Beaufort 27, North Sea), which must last at least ten years in a marine environment. On a monolithic light-stone base stands a 1.8×1.2 m screen: a lenticular panel held between two laminated glass panes, playing with the horizon. We are looking for a workshop to make the frame that carries this screen: a rectangular frame in 316L stainless steel tube, whose two uprights extend down and are set into the stone base. It is a one-off piece, simple to weld, built to last outdoors. The glazing is not part of this consultation. The dimensions below are our proposal: your view on what is simpler, safer or cheaper to make interests us as much as your price.

2. Main dimensions

Item	Dimension / value	Remark
Section	rectangular tube $80 \times 40 \times 3$ mm, 316L stainless	80 mm side facing the wind; 4 mm acceptable if you consider it preferable — please say so
Overall width	1,890 mm	between uprights: 1,810
Uprights	$2 \times 1,728$ mm	1,200 visible + 528 set into the base
Bottom rail	1,810 mm, welded	its top face is flush with the top of the base
Top rail	1,810 mm, removable	bolted after the glazing is inserted; connection to be proposed
Clear opening	$1,810 \times 1,120$ mm	receives a glass / lenticular / glass sandwich of about 30 mm
Glazing support	outside the tube, sea side	proposal: 40×6 flat-bar bead screwed on, 2 mm soft strips, no glass-to-metal contact — see § 3.3
Anchoring	2 pockets $\approx 50 \times 90 \times 528$ in the stone	resin or grout; cut by the stone workshop to your final dimensions
Mass	≈ 37 kg (7.1 m of tube)	two-person handling, no lifting gear
Finish	brushed, tube ends closed	sample to be agreed; visible welds ground and brushed

3. Part-by-part description

3.1 Uprights and bottom rail — Three $80 \times 40 \times 3$ tubes in 316L, assembled as a U with two corner welds (mitred or square cut, your choice), continuous seams, full penetration at the foot of the uprights. Uprights are closed top and bottom by a welded 3 mm plate; no water may enter the tubes. The embedded part (528 mm) may stay as-welded; two studs or cross bars welded on improve the anchorage in the resin.

3.2 Removable top rail — Same tube, fixed to the heads of the uprights by a demountable connection (stainless A4 plates and bolts, or sliding pinned inserts). It does not need to be rigid: once the glazing is clamped, the sandwich braces the frame. The connection should stay discreet when seen from the front: propose yours.

3.3 Glazing support (proposal) — The glass / lenticular / glass sandwich ($\approx 1,800 \times 1,200 \times 30$ mm, ≈ 60 kg, supplied by the glazing lot) bears against the outer face of the frame, sea side, on a 2 mm self-adhesive soft strip. It is retained by a bead frame of 40×6 stainless flat bar screwed into the tube (countersunk Torx A4 screws, pitch ≈ 200), with a second soft strip between bead and glass. No screw passes through the glass; the glazing stays removable on site. If you know a simpler or more elegant solution (angle, rebate profile, strip), it is welcome.

---	---	---

3.4 Wind and anchoring — Seafront: the frame is held by the embedment of the uprights, not by the frame corners. The stone base (≈ 6.7 t) receives two vertical pockets 528 mm deep; anchoring is done with resin or grout after plumbing. We have pre-sized the frame for wind and the structural engineer will confirm it; if you would rather use 4 mm wall, say so and price both.

3.5 What we ask of you — A quotation (excl. VAT) for the supply of the frame: tubes, removable top rail, beads and soft strips (or your alternative), 3.1 material certificate, finish. As an option: transport and setting of the uprights into the base at Westende (grouting included). Please state your lead time from order, your assumptions and any point of the file you find questionable.

4. Open points

- Tube wall (3 or 4 mm): your call; a quotation for both is welcome.
- Top-rail connection: bolted plates or sliding inserts.
- Glazing support detail: our 40 × 6 bead is a proposal; your usual solution interests us.
- The glazed sandwich will be 29 or 32 mm depending on the glass chosen (55.2 or 66.2): the bead must accommodate this.
- The base is still being studied; pocket dimensions will be frozen with base drawing V01.

The drawings in this file were prepared with the help of artificial intelligence, under the team's control. We are open to entrusting you with the shop drawings, or to working with the engineering office you suggest.
